```
The present sequence encodes the Lawsonia intracellularis flagellar hook protein FIGE. The present invention describes an isolated or recombinant polypeptide (I) that comprises, mimics or cross-reacts with a B- or T-cell epitope of a FIGE flagellar hook) polypeptide from a Lawsonia spp. (I) has antibacterial activity, and induces a specific humoral immune response. (I) are used as antigens in vaccines to prevent or treat infection by Lawsonia, in birds and animals, especially pigs, to raise specific antibodies (Ab) and to detect past or present infection. Ab are also useful in diagnosis, to detect L. intracellularis or immunologically oross-reactive species, also for identification of epitopes in FIGE. Vectors that contain nucleic acids (II) encoding (I) are also useful in genetic vaccines, and fragments of (II) are useful as primers or probes for detecting L. intracellularis or related microorganisms, in
                                                             New immunogenic Lawsonia FlgE peptide, its nucleic acid and antibody, useful in vaccines and diagnosis of Lawsonia infections, particularly in.
                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1509 BP; 511 A; 264 C; 316 G; 418 T; 0 U; 0 Other;

polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a product is overexpressed or underexpressed; (12) determining the extent or compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the constitution of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational for identifying proteins or screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. prewmoniae or P. aeruginosa. The present sequence is one of the target or provaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print of the contract of the printed of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ThrargaladiyasnPheargPheThrGlnAspGlyPheLeuAsnAspProSerGlyPhe 127

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a prometer operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated

elates to Pseudomonas aeruginosa polypeptides and the encoding them. The sequences are useful in diagnosis and ological conditions, as molecular targets for diagnostics, treatment of pathological conditions resulting from a tion, for evaluating a compound, such as a polypeptide, to bind a P. aeruginosa nucleic acid, as components of acterial targets, as tragets for antibacterial drugs, acterial targets, as templates for recombinant.

• aeruginosa-derived peptides or polypeptides, as target diagnosis and/or treatment of P. aeruginosa-caused in detection of P. aeruginosa sequences or other sequences species using biochip technology. Sequences ABD01397-ent P. aeruginosa polymucleotides of the invention. Note: ta for this patent did not form part of the printed ov/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                          eac acid encoding Pseudomonas aeruginosa polypeptide, targets for diagnostics, prophylaxis and treatment of ions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           laAsnAlaAsnThrIleGlyTyrLysGlnGlnGlnValValPheGlnAsp 43

```
The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa fuels, so templates for recombinant production of P. aeruginosa nucleic sor polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABD01397-CABD17967 represent P. aeruginosa polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed of Specification but was obtained in electronic format from USPFO at

modulating biofilm formation by ssistance, useful for treatment
  Identifying compound capable of modulating bacteria/bacterial antibiotic resistance, associated disease.
```

Claim 1; Page 70; 154pp; English

The invention comprises a method for identifying a compound capable of modulating biofilm formation by bacteria. The method of the invention is useful for identifying a compound capable of modulating biofilm formation by bacteria or modulating bacterial antibiotic resistance. The method of the invention is also useful for diagnosing and treating a subject (especially an immunocompromised human) that is afflicted with a biofilm-associated disease or disorder, such as: oystic fibrosis, AIDS; middle ear infections; acne; periodontal disease; catheter-associated infections; and medical device-associated infections. The present DNA sequence represents a gene that is used in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                           MetMetGlySerLeuPhelleGlyAlaThrGlyMetLysThrHisSerThrGlyLeuGly 20
                                                                                                                      New isolated Borrelia burgdorferi nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of infections, particularly Lyme disease.
                                                                                                                                                                                            AAX20248 to AAX20402 represent polynucleotide sequences isolated from Borralia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borralia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes, epidemic and endemic relapsing
                                                                                                                                                                                                                                                                                                          Sequence 111309 BP; 35956 A; 13151 C; 19075 G; 43117 T; 0 U; 10 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide, (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway compared for proliferation or that has an activity against a biological pathway in which a proliferation or the the test compound that inhibits expoliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a gene required for required gene or its gene product lies or agene on which the test compound that inhibits spoilferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound,'s activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous mucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. prewnyoliferation in cells other than S. aureus, S. typhimurium, conform part of the printed specification, but was obtained in cell ectronic format directly from WIPO at the print pot the print bot between the print sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zyskind JW;

-----AAACAAGTCAAT 31316

This cDNA sequence codes for Helicobacter pylori FIGE flagellar hook protein (see AAW80991). FIGE cDNA can be cloned from the J99 strain of H. protein (see AAW80991). FIGE cDNA can be cloned from the J99 strain of H. pylori by PorR amplification using primers (see AAV9814-15) specific for the 5 and 3' ends of the open reading frame. The FIGE polypeptide is used in a claimed vaccine, which further comprises an adjuvant (a pharmaceutically as a prophylactic vaccine in mammals (especially husses) infected by H. pylori. It is additionally used to form a composition in the treatment and diagnosis of H. pylori infection, and in eliciting a protective immune response against such infection. Diagnostic kits are formed for diagnosis and detection of H. pylori infection. The polypeptide elicits an immune response towards both the coccoidal and mechanisms locally in the stomach, which is important because systemic immunity only plays a limited role in protection against mucosal

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to new Proteus mirabilis polypeptides and polymucleotides. The invention also relates to antibodies against the polypeptides, amethod for producting the polypeptides, amethod of per producting the polypeptides, amethod for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polynucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial accines, as targets for antibacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drags or as bio-control agents for plants. This sequence represents a Proteus mirabilis polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                         New Proteus mirabilis polypeptides and polynucleotides, useful as reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                    The present invention relates to nucleic acid sequences (ABQ67188-ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-listeria vaccines. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from MIPO at ftp, wipo.int/pub/published_pct_sequences. (Updated on 29-AUG-2003 to standardise OS field)

S. A.

Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.

Claim 2; SEQ ID NO 6950; 1205pp; French

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. Luminescens and related species, to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of the genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microrganisms other than P. Luminescens and are able to alter response or sensitivity to toxins and antibocics produced by P. Luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes proteins, vectors containing the genes and Ab are also useful are sensitive to P. Luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence facts and for identifying targets of human diseases for which P. Luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. Luminescens genes

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the geneme of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/damplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/damplification of the genes are used for detection/damplification of the genes are used for detection/damplification of arry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibicties produced by P. luminescens. Cells transformed to express the genes are useful for ecombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes proteins, vectors containing the genes and Ab are also useful are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes
                                                                                                                                                Antibacterial; fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague; whooping cough; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Genomic sequence of Photorhabous luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10 ThrGlyMetLysThrHisSerThrGlyLeuGlyThrValSerAsnAsnIleAlaAsnAla

The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primeras, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving direction normal useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving abbrrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and or oproduce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences. AAS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the printed specification, but was obtained in the printed specification.
responsible for genetic disorders or other traits and to assess biodiversity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAX20248 to AAX20402 represent polynucleotide sequences isolated from Borrelia burgdorferi (Bb). Products derived from Bo can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as Lyme disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated Borrelia burgdorferi nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of infections, particularly Lyme disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ---AlaileGlySerThrGlySerGlnGlyProAsnGlnAlaGlyMet

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a careferial infection, for evaluating a compound, such as a polypeptide, of for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial dargs, as templates for antibacterial dargs, including anti-P. aeruginosa dargs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABD01397-Captesent P. aeruginosa polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed sequence. The sequence in the patent did not form part of the printed sequence. The sequence capta for this patent did not form part of the printed sequence. The sequence them
                                                                                                                                                                                                                                                      Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1545 BP; 226 A; 447 C; 568 G; 304 T; 0 U; 0 Other;

tes to the isolation of genes and their encoded brhabdus luminescens. The isolated sequences are ning primers for detecting the genome of P. luminescens; to study polymorphisms; for gene analysis and for their of the genes. Antibodies (Ab) raised against the day the genes are used for detection/identification e.g. in foods. The genes, proteins, Ab and cells that induce or inhibit expression of the genes in plants, anisms other than P. Luminescens and are able to altervity to coxins and antibiotics produced by P. transformed to express the genes are useful for ion of the proteins, particularly toxins and infection by bacteria or fungities. The setors containing the genes and Ab are also useful intection by bacteria or fungities. Intent microbial infection by bacteria or fungit hat luminescens-encoded toxins or antibiotics) and as ruses of the genes and the proteins are as virulence intifying targets of human diseases for which P. this one of the isolated P. luminescens genes

Helicobacter pylori nucleic acid sequences and related polypeptide(s) useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter.

Claim 1, Page, 1481pp; English.

The present sequence encodes a Helicobacter pylori flagella associated protein. The protein may be used in a vaccine to prevent or treat H.

Dyori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homelogy to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts. Note: This DNA sequence is not reproduced in the specification and has been derived from the related specification, W09719098

The present sequence encodes a Helicobacter pylori flagella associated protein, which was found to be homologous to flagellar basal body rod protein, which was found to be homologous to flagellar basal body rod corresponding following BLAST protein analysis. H. pylori has been strongly linked to chronic gastrifis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators of hubbitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The mucleic acid sequences, and corresponding proteins, are also useful for generating vaccines for immunising subjects against H. pylori or for use in detecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and conduct a median size of 2000 bp. Purified DNA fragments were bluntened and ligated to unique BstXI-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker adapter inserts were ligated to each of the 20 pWPX vectors to construct a series of shotgun subclone libraries. The purified DNA concatements has obtained from the related specification, W09640893
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 816 BP; 237 A; 199 C; 183 G; 197 T; 0 U; 0 Other;

Helicobacter pylori nucleic acid sequences and related polypeptide(s) useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter.

Claim 1; Page 909; 1481pp; English.

The present sequence encodes a Helicobacter pylori flagella-associated comembrane protein. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial CC from overlapping contigs generated by computer sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify CC likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant compounts of the known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in B. coli hosts

Recombinant basal body rod protein producible by a transformed host for use in immunological vaccine compositions for in vivo administration to protect against diseases caused by bacterial pathogens.

Claim 1a; Col 15-20; 28pp; English

This invention describes a novel recombinant basal body rod protein (I) producible by a transformed host containing an expression vector comprising a nucleic acid selected from; (a) an entire nucleic acid sequence of 1800 base pairs (bp), or the nucleic acid sequence of the FigF gene having 810 bp, both given in the specification; (b) a nucleic acid sequence, given in the specification; (c) a nucleic acid sequence acid sequence of the FigF protein, a 270 residue sequence, given in the specification; (d) a nucleic acid sequence according a functional FigF basal body rod protein of a flagellum of a protein of (ampylobacter; or (d) an immunogenic fragment of an FigF protein of (a), (b) or (c), and expression means operatively coupled to the nucleic acid molecule for expression means operatively coupled to the nucleic acid molecule for expression means operatively coupled to protein of a flagellum of a strain of Campylobacter. (I) is useful in immunological vaccine compositions for in vivo administration to protect against diseases caused by bacterial pathogens that produce basal body of monosasays, or for procedures for the detection of antibacterial, campylobacter, basal body rod protein and/or peptide antibodies. The product of the invention has immunostimulatory activity. This sequence encodes the Campylobacter jejuni flgF and flgG proteins described in the method of the invention

Sequence 1800 BP; 636 A; 251 C; 363 G; 550 T; 0 U; 0 Other;

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food pupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the Campylobacter flgFG operon of the invention. The encoded flgF and flgG proteins are basal body rod proteins of the flagellum of the Campylobacter. The nucleic acid and host cell containing it, are useful for the recombinant production of Campylobacter, especially C. jejuni, basal body rod proteins. This bacterium is the especially C. jejuni, basal body rod proteins. This bacterium is the produced can be used to raise antibodies, which in turn can be used to produced can be used to raise antibodies, which in turn can be used to Additionally, the peptides, and specifically the live vectors (e.g. poxor vaccinia virus) can be used as vaccines against the bacterium, and the antibodies can be used for passive immunisation. The nucleic acids can also be used to detect the presence of the bacterium
                                                                                                                                                                                                                                                                                                                                DNA encoding Campylobacter flagellum basal body rod proteins - useful for recombinant production of the proteins for use as vaccines against the bacterium, and for its detection, additionally with antibodies raised

Example 1; Col 21-22; 28pp; English. $\overset{\alpha}{\times}\overset{\times}{\times}\overset{\circ}{\circ}{\circ}\overset{\circ}$

producible by a transformed host containing an expression vector.

Comprising a muclaic acid selected from; (a) an entire nuclaic acid sequence of the FigF gene having Bio base pairs (bp), or the nuclaic acid sequence of the FigF gene having Bio by, both given in the specification; (b) a nuclaic acid sequence.

Sequence, given in the specification; (c) a nuclaic acid sequence of the recoding a functional FigF basal body rod protein of a flagellum of a strain of Campylobacter; or (d) an immunogenic fragment of an FigF protein of (a), (b) or (c), and expression means operatively coupled to protein of a flagellum of a strain of Campylobacter; (I) is useful in immunological vaccine compositions for invivo administration to protect against diseases caused by bacterial pathogens that produce basal body rod proteins. (I) are also useful as immunogens, as antigens in immunosassy, or for procedures for the detection of antibacterial, immunosassy, or for procedures for the detection of antibacterial, immunosassy, or for procedures for the detection of antibacterial, immunosassy, or for procedures for the detection of antibacterial, immunosassy, or for procedures for the detection of antibacterial, the product of the invention has immunostimulatory activity. This sequence encodes the Campylobacter jejuni flgg protein described in the method of the invantion has immunostimulatory activity. invention describes a novel recombinant basal body rod protein (I) the invention

Sequence 789 BP; 260 A; 127 C; 179 G; 223 T; 0 U; 0 Other;

The invention describes a method of monitoring differential expression of genes in a first Bacillus cells relative to expression of the genes in other bacillus cells to a substrate containing array of Bacillus cells to a substrate containing array of Bacillus cells to a substrate containing array of Bacillus genemic sequenced tags (GST), examining the array, and determining containing array of Bacillus cells useful for measuring the expression of a spot in the array. The method is useful for measuring the expression of a spot in a first Bacillus cell relative to expression of the same genes of in one or more second Bacillus cells. The method is useful for monitoring gene copy number variation and stability. Monitoring can copy number variation and stability. Monitoring can copy number variation and stability. Monitoring can copy number variation and stability. Monitoring can copy number variation and stability. Monitoring can consist of the way in expression of genes may be used to provide a representation of the way in expression of genes may be used to provide a representation of the way on that a stress or other physiological provocation. Extensive follow up characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is available. This sequence represents a genomic sequence date (or this patent did not form part of the printed specification, but, was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ThrSerSerGlyAsnSerThrAlaArgAsnGlySerSerSerThrArgArgTyrSerGln 379
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      part of the printed specification, but was obtained in electro
directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Kapur V, Gebhart CJ;

2004-340902/31. P-PSDB; ADM91689 New nucleic acid that generates an amplification product from L. intracellularis nucleic acid using an appropriate second nucleic acid molecule, useful for treating and preventing L. intracellularis

Disclosure; SEQ ID NO 28; 87pp; English

The present invention describes an isolated nucleic acid comprising a nucleic acid molecule of at least 10 nucleotides in length having at least 75% identity to SEQ ID NO:8741 (ADM91733), where any of the amplecule that is 10-29 nucleotides in length, under standard amplification conditions, generates an amplification product from Lawsonia intracellularis nucleic acid using an appropriate second nucleic acid molecule. Also described: (1) a vector comprising the nucleic acid;

cc comprising the vector; (3) an isolated polypeptide encoded by the nucleic acid; (4) an article of manufacture comprising the colypeptide; (5) an antibody having specific binding affinity for the colypeptide; (6) a method for detecting the presence or absence of intracellularis in a biological sample; (7) a method of preventing intracellularis in an animal; (8) a composition of comprising a first oligonucleotide primer and a second oligonucleotide primer, where the first and second primers are each 10 to 50 nucleotides in length, and where in the presence of I. intracellularis nucleic acid, generate an amplification product in the presence of nucleic acid from an organism other than I. intracellularis; and (9) an article of manufacture comprising the composition. The nucleic acid comprising the composition. The nucleic acid comprising the composition. The nucleic acid comprising the composition of in immunotherapy. The nucleic acid and polypeptides are useful for treating and preventing C intracellularis infection e.g. proliferative enteropathy. The present sequence represents an L. intracellularis specific nucleic acid molecule, compliant in the exemplification of the present invention.

Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag Differential gene expression; genomic sequenced tag; GST; altered culture condition; environmental stress; physiological provocation; ds. sequence tag (GST) Claim 4; SEQ ID NO 1846; 200pp; English Bacillus licheniformis genomic (NOVO) NOVOZYMES BIOTECH INC (NOVO) NOVOZYMES AS. DNA; 1524 06-OCT-2000; 2000US-00680598, 27-MAR-2001; 2001US-0279526P. 05-OCT-2001; 2001WO-US031437 (first entry) Bacillus licheniformis Clausen IG; WPI; 2002-416684/44. standard; directly from WIPO WO200229113-A2 Sequence 1524 ABK74555

The invention describes a method of monitoring differential expression of genes in a first Bacillus cells. Comprising hybridising labelled nucleic acid probes isolated from Bacillus cells. Comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells ribe expression of the same genes in one or more second Bacillus cells The method is useful for monitoring gene copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions, environmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is available. This sequence represents a genomic sequence cate (GST) used in the method of the invention. This invention relates to a novel Bacillus licheniformis (B. licheniformis) mutant host cell derived from a parent B. licheniformis host call that is mutated in genes encoding secreted polypeptides.

Specifically, it refers to the generation of an improved Bacillus host that reduces the need for product purification caused by contaminant secreted native polypeptides in the outlare medium. Accordingly, the present invention describes reducing the expression of these native present invention describes reducing the expression of these native protecties (e.g. proteclytic enzymes, nutrient uptake factors and signal molecules), which in turn makes it easier to purify the heterologous product of interest and therefore improving the production process.

Further benefits of a mutated host cell include an increase in total product stability and purify. This polymucleotide is a DNA sequence product stability and purify. This polymucleotide is a DNA sequence encoding a mutant B. licheniformis secreted polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AsnvalaspMetSerArgGluMetValasnMetIleIleIleGlnArgGlyPheGlnMet 482
